

AGSWORLD

Assessment Installation

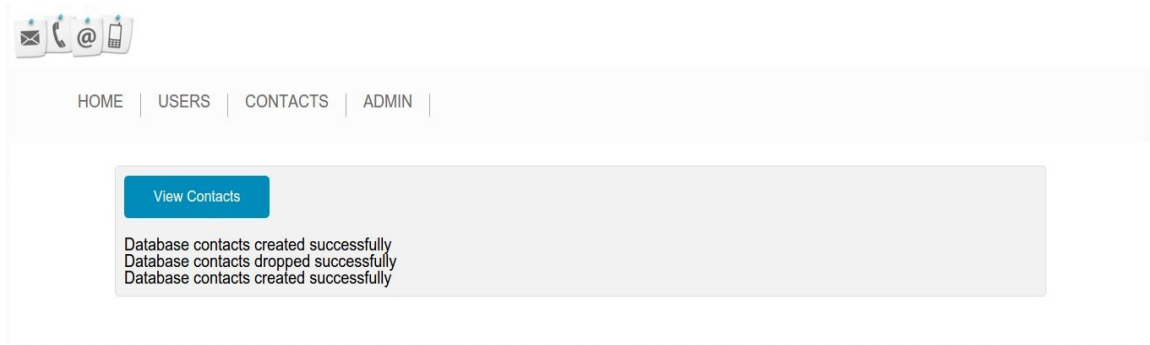

v1.00

How to install the application.

1. Make sure you have installed PHP 5.4 and Apache2
2. Copy all contents of **contacts-manager.zip** and unzip the file or clone <https://github.com/thabelo/contacts-manager.git> into your server directory.
3. Copy file **`application/Config/database.conf.sample.php`** and rename to **`application/Config/database.conf.php`** into same directory then edit the file to match your database settings.

```
public $default = array(
    'datasource' => 'Database/Mysql',
    'persistent' => false,
    'host' => 'localhost',           // HOST MACHINE
    'user' => 'root',               // HOST USERNAME
    'password' => 'password',      // HOST PASSWORD
    'database' => 'contacts',       // HOST DATABASE (*Optional to change)
);
```

4. Navigate to **agsworld** and application should take you to the admin page and install the database and initialize tables.

5. Once all is done you can navigate through the application to **add users, add contacts and add contact types** (basics types are inserted on schema creation).
 1. Add Users
 1. Add users for contacts in 2.
 2. Add Contacts
 1. Add contacts for users in 1
 3. Add Contact Types
 1. Add contact types for contacts in 2
6. Manual Database installation
 1. Should you choose to install/import database from **'migrations/schema/contacts.sql'** make sure **`application/Config/database.conf.php`** database name is **contact** i.e **'database' => 'contacts'**
 2. If you choose this process there application will not require you to do installation anymore.

Good luck!
